

# Toyota Avalon Grande Reset Procedure (RHF)

*Sliding plate should be two thirds down from the top.*

1. Take your motor and plug it into the wiring harness on the car **WITHOUT THE REGULATOR ATTACHED**.
2. Using the master switch, pull all the way up and allow the motor to spin for approximately 30 turns.
3. As the diagram shows, ensure the regulator slider is in the correct position. This is the required position to bolt the glass on and to initiate the learning procedure.
4. Assemble the motor to the regulator and bolt it back into the door.
5. The motor **MUST NOT** be powered in any direction at this stage.
6. Secure the glass to the regulator and plug in the motor loom.
7. Using the master switch, pull up all the way in the **UP THE DIRECTION ONLY**. Continue holding up until the window is fully closed and continue to **HOLD** for 1 or 2 seconds.
8. You can now power the motor in the auto down cycle.
9. To check that you have set the memory correctly, power the window in the **AUTO UP** cycle. The glass should power to the closed position and stop there.

If you have any further problems, please feel free to phone us on (07) 3267 8998 for advice and further assistance.
